

Experiment – 1 a: TypeScript

| | |
|-----------------|------------------------|
| Name of Student | <u>Madhura Jangale</u> |
| Class Roll No | <u>D15A_20</u> |
| D.O.P. | |
| D.O.S. | |
| Sign and Grade | |

Aim: Write a simple TypeScript program using basic data types (number, string, boolean) and operators.

Problem Statement:

- a. Create a calculator in TypeScript that uses basic operations like addition, subtraction, multiplication, and division. It also gracefully handles invalid operations and division by zero..
- b. Design a Student Result database management system using TypeScript.

// Step 1: Declare basic data types

```
const studentName: string = "John Doe";
```

```
const subject1: number = 45;
```

```
const subject2: number = 38;
```

```
const subject3: number = 50;
```

// Step 2: Calculate the average marks

```
const totalMarks: number = subject1 + subject2 + subject3;
```

```
const averageMarks: number = totalMarks / 3;
```

// Step 3: Determine if the student has passed or failed

```
const isPassed: boolean = averageMarks >= 40;
```

// Step 4: Display the result

```
console.log(Student Name: ${studentName});
```

```
console.log(Average Marks: ${averageMarks});
```

```
console.log(Result: ${isPassed ? "Passed" : "Failed"});
```

Theory:

- a. What are the different data types in TypeScript? What are Type Annotations in Typescript?

Different Data Types in TypeScript TypeScript provides a variety of built-in data types, including:

1. Number: Represents both integer and floating-point values.
Eg: let age: number = 25;
2. String: Represents textual data.
Eg: let name: string = "John";
3. Boolean: Represents true or false values.
Eg: let isStudent: boolean = true;
4. Array: Represents a collection of elements of the same type.
Eg: let numbers: number[] = [1, 2, 3];
5. Tuple: Represents an array with fixed types and a specific length.
Eg: let person: [string, number] = ["Alice", 30];
6. Enum: Represents a set of named constants.
Eg: enum Color {Red, Green, Blue}
7. Any: Represents any data type, used when the type is unknown.
8. Void: Used for functions that do not return a value.
9. Null and Undefined: Represent null and undefined values.
10. Never: Represents values that never occur (e.g., functions that throw errors).

Type Annotations in TypeScript Type annotations explicitly specify the type of a variable, function parameter, or return value.

Eg:

```
let message: string = "Hello, TypeScript!";  
function add(a: number, b: number): number {  
    return a + b;  
}
```

b. How do you compile TypeScript files?

Compiling TypeScript Files To compile TypeScript files, you need to use the TypeScript compiler (`tsc`). First, install TypeScript globally if not already installed. Then, compile a single file using the `tsc` command followed by the filename. This generates a corresponding JavaScript file. You can also compile multiple files at once, watch for changes with the `-watch` flag, or configure project-wide compilation using a `tsconfig.json` file. The `tsconfig.json` file allows setting compiler options such as target JavaScript version, output directory, and strict type-checking rules.

c. What is the difference between JavaScript and TypeScript?

Difference Between TypeScript and JavaScript

| Feature | JavaScript | TypeScript |
|-----------------|---|--|
| Typing | Dynamically typed | Statically typed |
| Compilation | No compilation required | Needs compilation using <code>tsc</code> |
| Interfaces | Not supported | Supported |
| Generics | Not supported | Supported |
| Modularity | Uses ES6 modules | Stronger support for modules |
| Debugging | More runtime errors | Fewer runtime errors due to type safety |
| OOP Features | Limited class-based OOP | Fully supports OOP concepts like class, interfaces, and access modifiers |
| Tooling Support | Basic support | Better support with IDEs due to static typing |
| Use Case | Suitable for small projects and quick scripting | Preferred for large-scale applications with maintainability in mind |

d. Compare how Javascript and Typescript implement Inheritance.

| Feature | Class | Interface |
|----------------|---------------------------------|---|
| Definition | Blueprint for creating objects | Defines structure but has no implementation |
| Implementation | Can have methods and properties | Only defines properties/methods but does not implement them |
| Inheritance | Can extend another class | Can extend multiple interfaces |
| Use Case | Used for object instantiation | Used for defining a contract |

Interfaces are used to define object shapes, function signatures, and enforce structure in class implementations. They help maintain consistency in data structures, making the code more maintainable and scalable.

- e. How generics make the code flexible and why we should use generics over other types. In the lab assignment 3, why the usage of generics is more suitable than using any data type to handle the input.

Generics make the code flexible by allowing it to handle different data types without specifying a concrete type. Instead of writing separate methods or classes for different types, generics enable you to write reusable and type-safe code.

Why Use Generics Over Other Types?

2. **Type Safety:** Generics ensure that only the expected data type is used, reducing runtime errors caused by incorrect type casting.
3. **Code Reusability:** Instead of writing multiple versions of a method or class for different types, generics allow a single, reusable implementation.
4. **Compile-Time Checking:** Errors are caught at compile-time rather than at runtime, improving code reliability.
5. **Eliminates Type Casting:** Without generics, you would need explicit type casting, which increases the risk of `ClassCastException`. Generics eliminate the need for this casting.

f. What is the difference between Classes and Interfaces in Typescript? Where are interfaces used?

Difference Between Classes and Interfaces in TypeScript

| Feature | Class | Interface |
|----------------|---|--|
| Definition | Blueprint for creating objects with properties and methods. | Defines a contract for an object's structure but does not provide implementation. |
| Implementation | Can have constructors, properties, and method implementations. | Only declares method signatures and properties; no implementation. |
| Instantiation | Can create objects using <code>new</code> keyword. | Cannot be instantiated directly. |
| Inheritance | Supports inheritance (<code>extends</code>). | Supports multiple inheritance (<code>extends</code> multiple interfaces). |
| Usage | Used to create reusable object blueprints. | Used to enforce a structure for objects and classes. |
| Modifiers | Can have <code>public</code> , <code>private</code> , <code>protected</code> modifiers. | Cannot have access modifiers (<code>public</code> , <code>private</code> , etc.). |
| Performance | Generates JavaScript code. | Only used for type checking, does not exist in JavaScript output. |

Output:

```
● PS D:\madhura\Sem 6\Web X> npm install typescript --save-dev  
added 1 package in 2s
```

```
● PS D:\madhura\Sem 6\Web X> npm install -g tsx  
>>  
  
added 5 packages in 5s  
  
2 packages are looking for funding  
run `npm fund` for details
```

1. Calculator.ts

```
function calculator(a: number, b: number, operator: string): number | never {  
  switch (operator) {  
    case "+":  
      return a + b;  
    case "-":  
      return a - b;  
    case "*":  
      return a * b;  
    case "/":  
      if (b === 0) {  
        throw new Error("Division by zero is not allowed!"); // Throws error, function never  
        returns a value  
      }  
      return a / b;  
    default:  
      throw new Error(`Invalid operator: '${operator}'. Use +, -, *, or /.`); // Throws error,  
      function never returns a value  
    }  
  }  
}
```

// Example Usage

```
try {  
  console.log(calculator(10, 2, "+")); // Output: 12  
  console.log(calculator(10, 2, "-")); // Output: 8  
  console.log(calculator(10, 2, "*")); // Output: 20
```

```
console.log(calculator(10, 2, "/")); // Output: 5
console.log(calculator(10, 0, "/")); // Throws Error: Division by zero is not allowed!
console.log(calculator(10, 2, "%")); // Throws Error: Invalid operator
} catch (error) {
  console.error((error as Error).message);
}
```

```
PS D:\madhura\Sem 6\Web X> tsx calc.ts
12
8
20
5
Division by zero is not allowed!
```

2. Student.ts

```
interface Student {
  name: string;
  class: string;
  rollNo: number;
  subject: string;
  marksObtained: number;
  totalMarks: number;
  percentage?: number;
  result?: string;
}
```

```
function calculateResult(student: Student): Student {
  student.percentage = (student.marksObtained / student.totalMarks) * 100;
  student.result = student.percentage >= 40 ? "Pass" : "Fail";
  return student;
}
```

```
const students: Student[] = [
  {
    name: "Madhura Jangale",
    class: "D15A",
    rollNo: 20,
    subject: "Web X",
    marksObtained: 95,
```

```

    totalMarks: 100
  },
  {
    name: "Asmita Nair",
    class: "D15A",
    rollNo: 1,
    subject: "Web X",
    marksObtained: 40,
    totalMarks: 100
  },
  {
    name: "Yash Joshi",
    class: "D15A",
    rollNo: 67,
    subject: "Web X",
    marksObtained: 80,
    totalMarks: 100
  },
  {
    name: "Meera Deshmukh",
    class: "D15A",
    rollNo: 47,
    subject: "Web X",
    marksObtained: 50,
    totalMarks: 100
  },
  {
    name: "Rahul Chopra",
    class: "D15A",
    rollNo: 40,
    subject: "Web X",
    marksObtained: 30,
    totalMarks: 100
  }
];

```

```
const updatedStudents = students.map(calculateResult);
```

```

updatedStudents.forEach(student => {
  console.log("Student Details:");
  console.log(`Name: ${student.name}`);
  console.log(`Class: ${student.class}`);

```

```
console.log(`Roll No: ${student.rollNo}`);  
console.log(`Subject: ${student.subject}`);  
console.log(`Marks Obtained: ${student.marksObtained}`);  
console.log(`Total Marks: ${student.totalMarks}`);  
console.log(`Percentage: ${student.percentage}%`);  
console.log(`Result: ${student.result}`);  
console.log("-----");  
});
```

● PS D:\madhura\Sem 6\Web X> **tsx** student.ts

Student Details:
